Chapter 1 Aerodynamics

Lift is the force that acts perpendicular to the relative wind. The angle of attack is the angle between the chord line and the relative wind.

When the critical angle of attack is exceeded the airflow separates from the upper surface and the wing will stall.

Chapter 2 Meteorology

A METAR is a routine aviation weather report issued every thirty minutes or every hour.

Fog forms when the air cools to its dew point near the ground.

Chapter 3 Navigation

Magnetic variation is the angle between true north and magnetic north.
